

Boldstar Infrared Aerial Roof Survey Service

Introduction to Our Aerial Roof Services

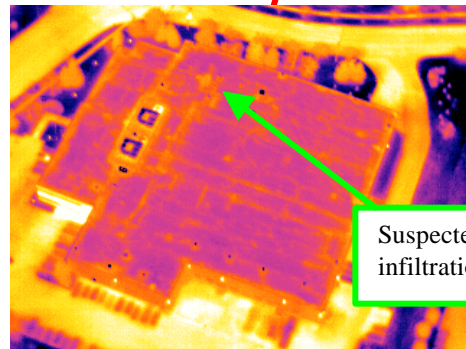

This service has been developed and designed to provide sales advantages to low-slope roof sales professionals.

Using helicopters and infrared imaging equipment, our aerial imaging service flies over requested buildings that have low-sloped roofing systems. We take high-resolution infrared images of each building to identify roof moisture issues if they are present.

We then deliver these infrared images with matching building street locations to you. Numerous buildings are inspected, our typical packages include as many as 100 buildings.

The resulting information can be a great advantage to roof sales professionals. An infrared image that suggests roof moisture issues are present is an attention getting tool for cold calls and developing new sales leads.

Ask about our “exclusive data” option...with our exclusive data package, requested areas or building images can be purchased and owned exclusively by you or your company.

We have been providing infrared surveys to roofing professionals since 1998.

All of our technicians are certified thermographers with extensive roofing application experience.

Servicing Toronto, the GTA and the World.
